

The Integrative Omics Group at PNNL is seeking postdoctoral fellow to join our multi-disciplinary team with a focus on mass spectrometry-based omics analyses. The postdoc will be working across multiple cutting-edge and synergistic NIH-funded projects on human physiology and metabolism. The individual will be performing a single or a combination of deep mass spectrometry-based omics (proteomics, lipidomics, metabolomics, and/or analysis of post-translational modifications) and functional and analyses of cells, tissues, protein complexes, and biofluids to discover and probe novel mechanistic pathways that drive normal human development and dysregulations that contribute to diseases. Interested candidates should send their CV, cover letter, a brief statement of their research interests, and three references to Dr. Ernesto Nakaya (ernesto.nakayasu@pnnl.gov).
